Persistence design decisions

- * Repository pattern: one repository per aggregate/table, sharing generic CRUD in BaseJdbcRepository.
- * Single-table inheritance: User, Customer, InteriorDesigner and Admin all persist to 'users'; discriminator column = role (CUSTOMER / ID / ADMIN).
- * BaseEntity is a mapped superclass: created_at / updated_at are copied into each child table.
- * companies.owner_user_id is UNIQUE, which enforces the 1:1 InteriorDesigner-Company rule.
- * project_views.user_id is nullable: anonymous views are tracked via session_id.
- * Project -> ProjectImage is a composition: images are removed together with their project.
- * All DB access goes through ConnectionManager (pooled connections, explicit transactions).
